Migration in a non-turbulent disc

Gap opening criteria

Disc scale height

Stellar mass

$$\frac{3}{4} \frac{H}{R_{\text{Hill}}} + \frac{50 M_*}{M_p \mathcal{R}} \leq 1$$

Planet mass

Viscosity

Migration - Type I

- Low mass planets
- No gap opening in disc
- Migration rate is fast
- Depends strongly on thermodynamics of the disc

Migration - Type II

- Massive planets (typically bigger than Saturn)
- Opens a (clear) gap
- Migration rate is slow
- Follows viscous evolution of the disc

Migration - Type III

- Massive disc
- Intermediate planet mass
- Ties to open gap
- Very fast, few orbital timescales

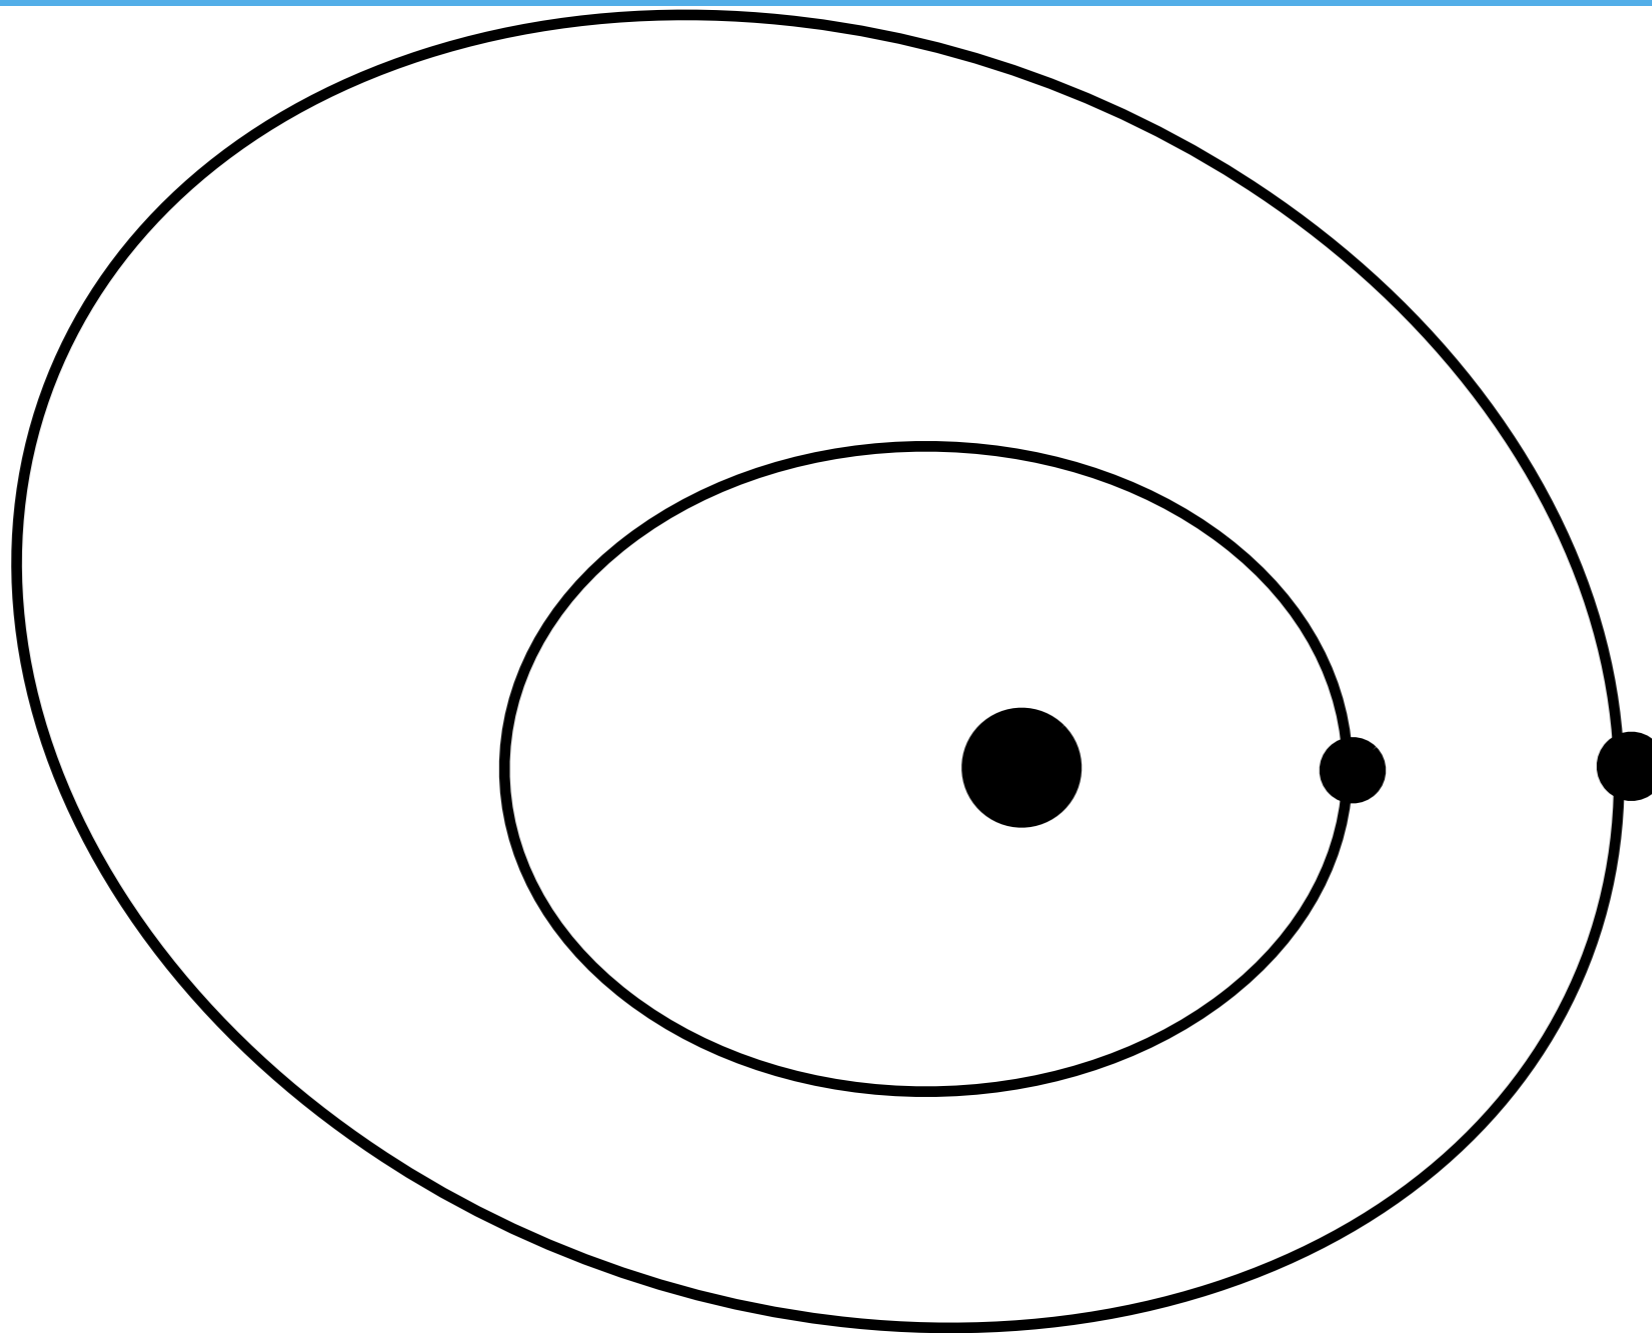

Resonance capture

2:1 Mean Motion Resonance

2:1 Mean Motion Resonance

2:1 Mean Motion Resonance

Resonant angles

- Fast varying angles

$$\lambda_1 - \varpi_1 \qquad \lambda_2 - \varpi_2$$

- Slowly varying combinations

$$\phi_1 = \lambda_2 - 2\lambda_1 + \varpi_2$$

$$\phi_2 = \lambda_2 - 2\lambda_1 + \varpi_1$$

$$\Delta\varpi = \varpi_1 - \varpi_2$$

- Two are linear independent

Non-turbulent resonance capture: two planets

$$\phi_1 = \lambda_2 - 2\lambda_1 + \varpi_2$$

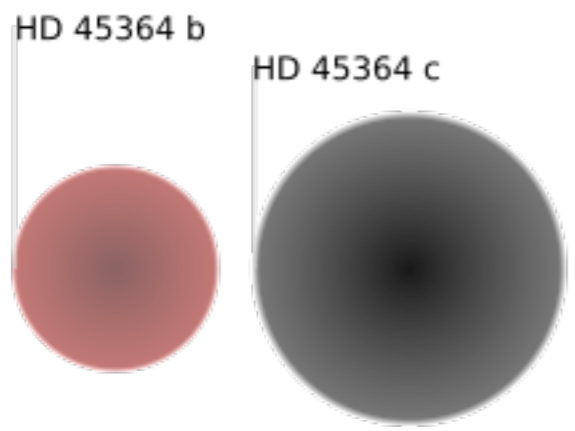

Take home message I

planet + disc = migration

2 planets + migration = resonance

HD 45364

HD45364

Formation scenario for HD45364

- Two migrating planets

- Infinite number of resonances

1:2 7:8 3:2 1:3 3:4

- Migration speed is crucial

- Resonance width and libration period define critical migration rate

Formation scenario for HD45364

Formation scenario for HD45364

Massive disc (5 times MMSN)

- Short, rapid Type III migration
- Passage of 2:1 resonance
- Capture into 3:2 resonance

Large scale-height (0.07)

- Slow Type I migration once in resonance
- Resonance is stable
- Consistent with radiation hydrodynamics

Formation scenario leads to a better 'fit'

Parameter	Unit	Correia et al. (2009)		Simulation F5	
		b	c	b	c
$M \sin i$	$[M_{\text{Jup}}]$	0.1872	0.6579	0.1872	0.6579

Migration in a turbulent disc

Turbulent disc

- Angular momentum transport
- Magnetorotational instability (MRI)
- Density perturbations interact gravitationally with planets
- Stochastic forces lead to random walk
- Large uncertainties in strength of forces

Animation from Nelson & Papaloizou 2004

Random forces measured by Laughlin et al. 2004, Nelson 2005, Oischi et al. 2007

Random walk

pericenter

eccentricity

semi-major axis

time

Correction factors are important

$$(\Delta a)^2 = 4 \frac{Dt}{n^2}$$

$$(\Delta \varpi)^2 = \frac{2.5 \gamma Dt}{e^2 n^2 a^2}$$

$$(\Delta e)^2 = 2.5 \frac{\gamma Dt}{n^2 a^2}$$

Two planets: turbulent resonance capture

Multi-planetary systems in mean motion resonance

- Stability of multi-planetary systems depends strongly on diffusion coefficient
- Most planetary systems are stable for entire disc lifetime

Modification of libration patterns

- HD 128311 has a very peculiar libration pattern
- Can not be reproduced by convergent migration alone
- Turbulence can explain it
- More multi-planetary systems needed for statistical argument

HD200964

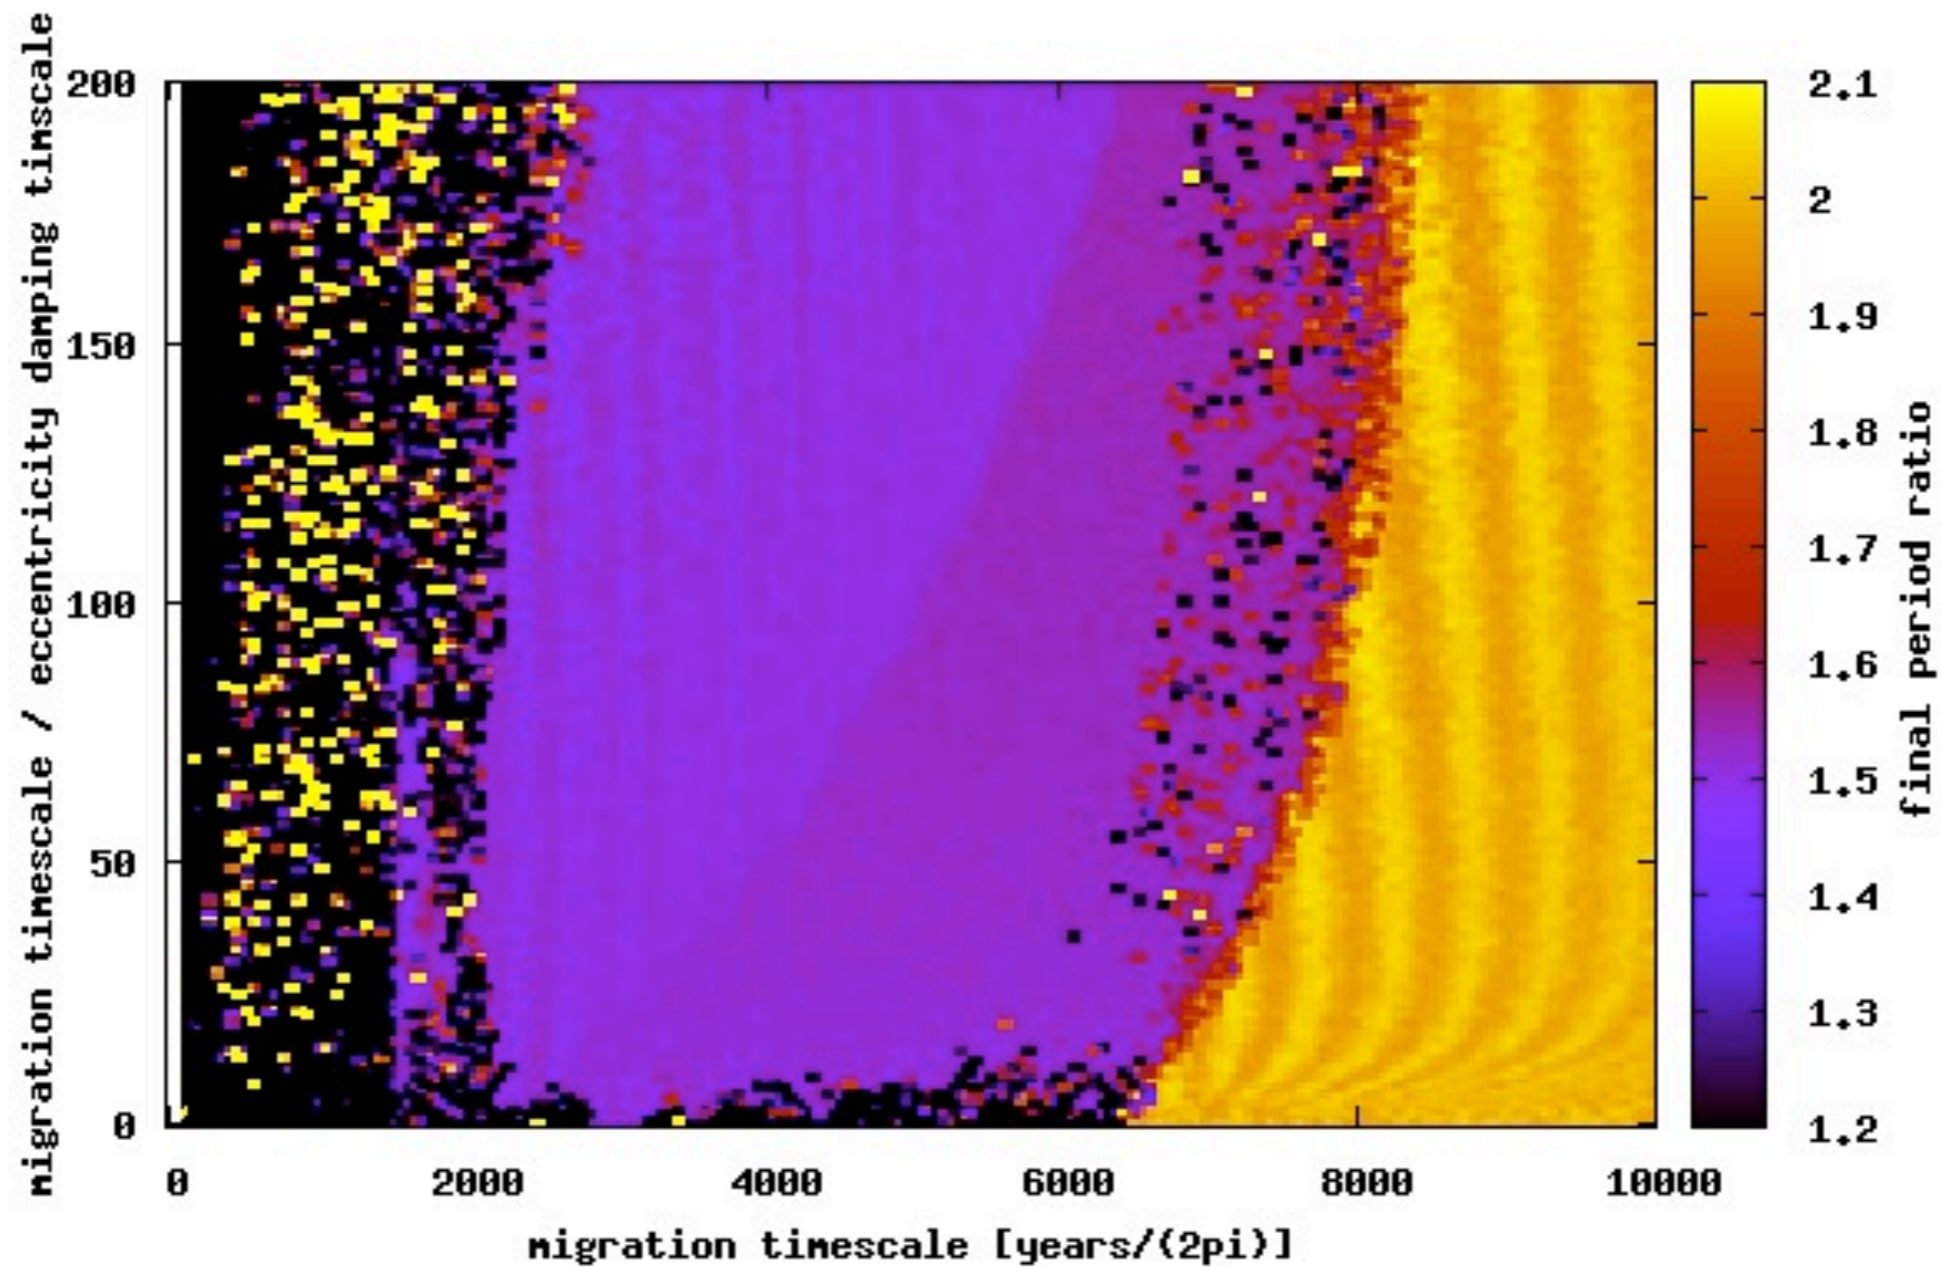

The impossible system?

Radial velocity curve of HD200964

- Two massive planets
 $1.8 M_{\text{Jup}}$ and $0.9 M_{\text{Jup}}$
- Period ratio either
3:2 or 4:3
- Another similar
system, to be
announced soon
- How common is 4:3?
- Formation?

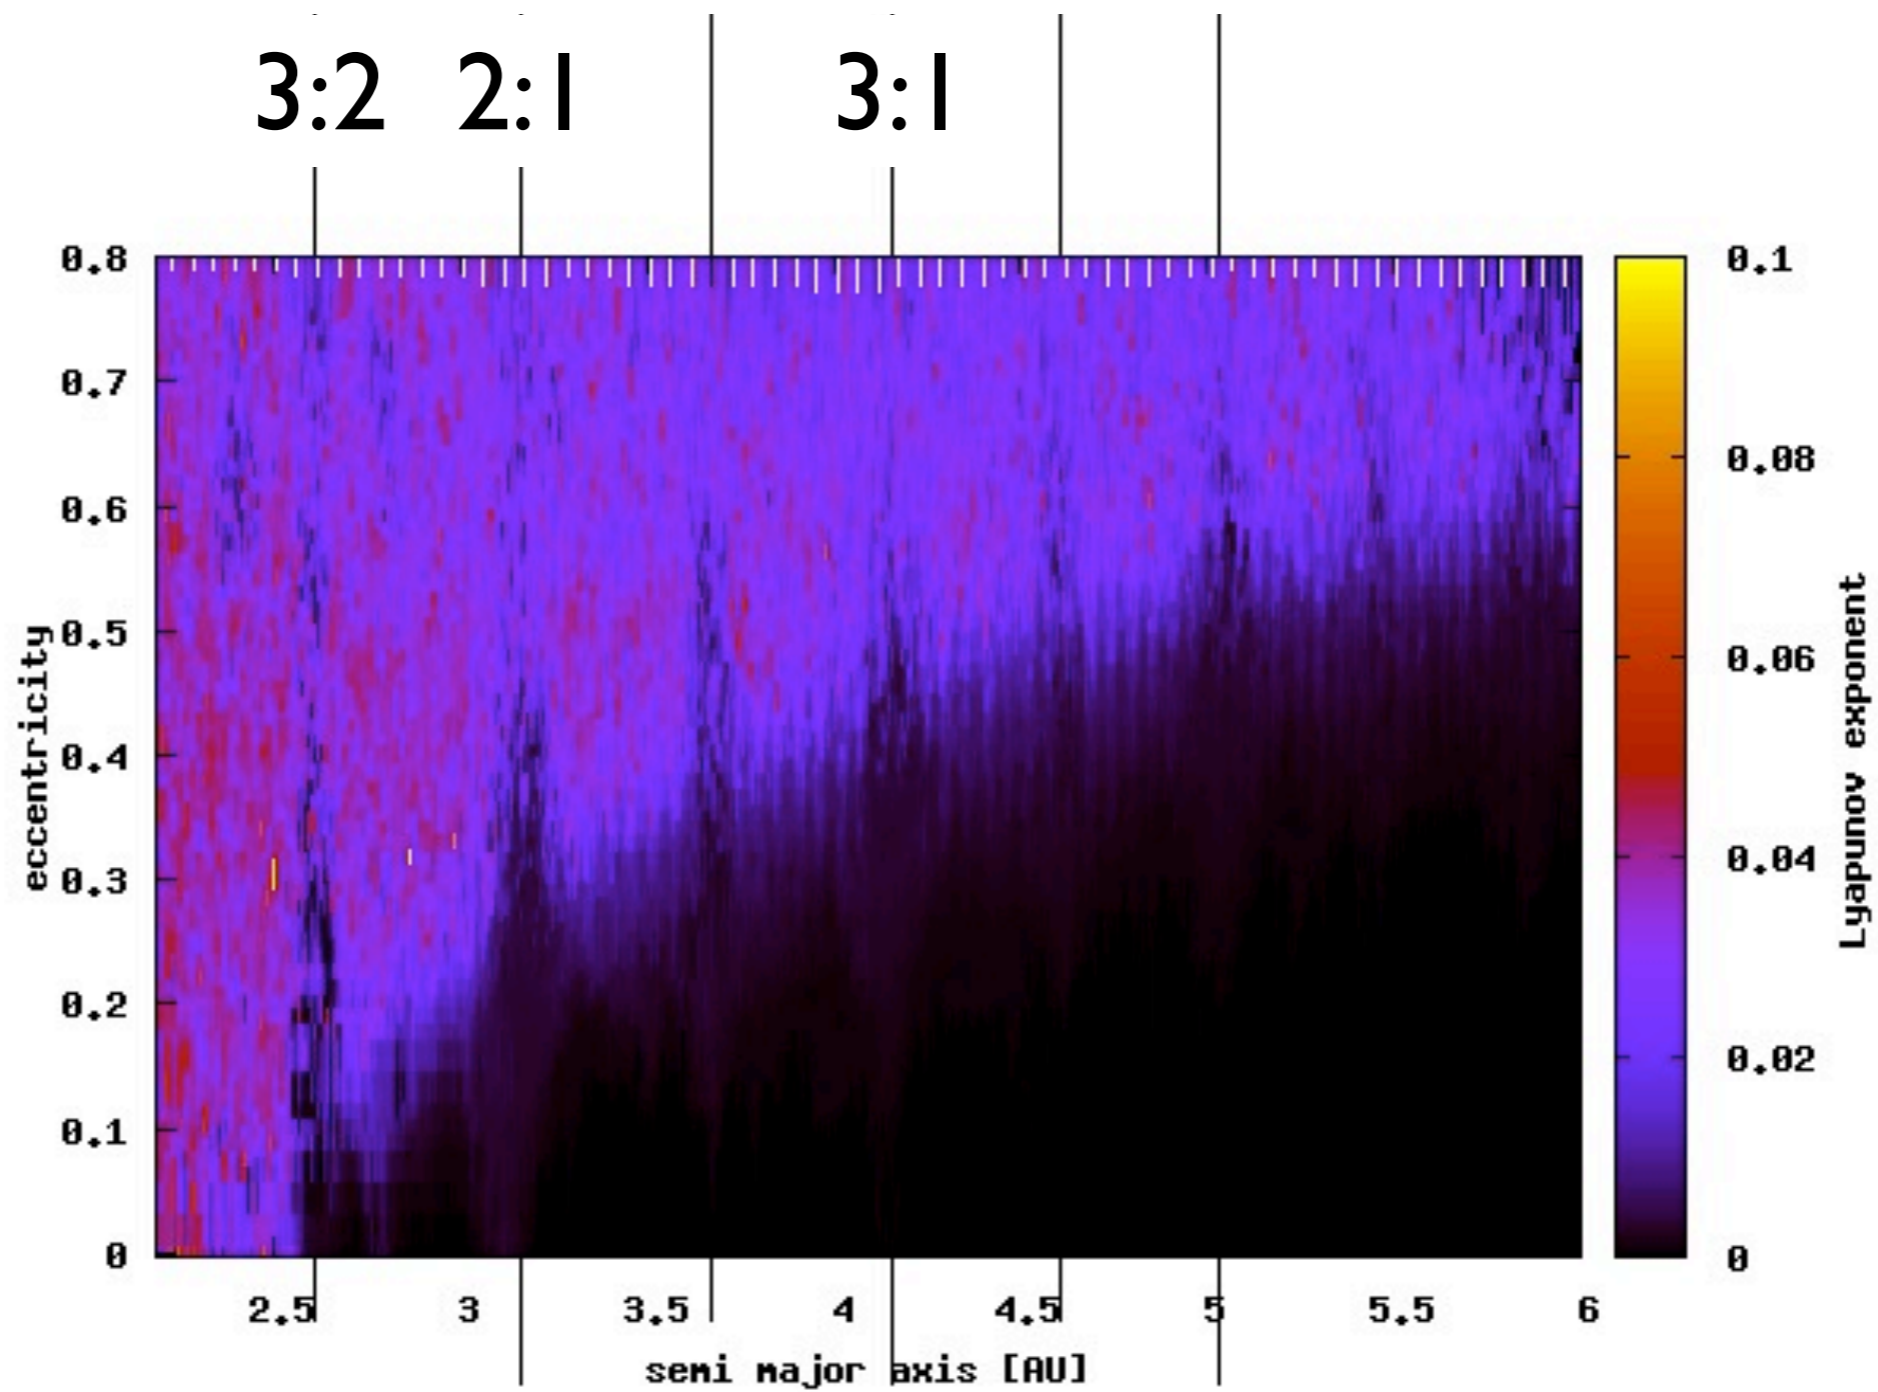

Standard disc migration doesn't work

Hydrodynamical simulations

Stability of HD200964

- In situ formation?
- Main accretion while in 4:3 resonance?
- Planet planet scattering?
- A third planet?
- Observers screwed up?

Moonlets in Saturn's Rings

Cassini spacecraft

Propeller structures in A-ring

Longitude residual

Mean motion [rad/s]

$$n = \sqrt{\frac{GM}{a^3}}$$

Mean longitude [rad]

$$\lambda = n t$$

$$\lambda(t) - \lambda_0(t) = \int_0^t (n_0 + n'(t')) dt' - \underbrace{\int_0^t n_0 dt'}_{n_0 t}$$

Observational evidence of non-Keplerian motion

Random walk

Analytic model

Describing evolution in a statistical manner
Partly based on Rein & Papaloizou 2009

$$\Delta a = \sqrt{4 \frac{Dt}{n^2}}$$

$$\Delta e = \sqrt{2.5 \frac{\gamma Dt}{n^2 a^2}}$$

N-body simulations

Measuring random forces or integrating moonlet directly
Crida et al 2010, Rein & Papaloizou 2010

Random walk

Work in progress: a statistical measure

**Saturn's rings

small scale version of
a proto-planetary disc**

REBOUND

A new open source collisional N-body code

Numerical Integrators

- We want to integrate the equations of motions of a particle

$$\dot{x} = v$$

$$\dot{v} = a(x, v)$$

- For example, gravitational potential

$$a(x) = -\nabla\Phi(x)$$

- In physics, these can usually be derived from a Hamiltonian

$$H = \frac{1}{2}p^2 + \Phi(x)$$

- Symmetries of the Hamiltonian correspond to conserved quantities

Numerical Integrators

- Discretization

$$\dot{x} = v$$

$$\dot{v} = a(x, v)$$

$$\Delta x = v \Delta t$$

$$\Delta v = a(x, v) \Delta t$$

- Hamiltonian

$$H = \frac{1}{2}p^2 + \Phi(x)$$

?

- The system is governed by a 'discretized Hamiltonian', if and only if the integration scheme is symplectic.
- Why does it matter?

Symplectic vs non symplectic integrators

Mixed variable integrators

- So far: symplectic integrators are great.
- How can it be even better?
- We can split the Hamiltonian:

$$H = H_0 + \epsilon H_{\text{pert}}$$

Integrate particle exactly
with dominant Hamiltonian

Integrate particle exactly
under perturbation
Hamiltonian

- Switch back and forth between different Hamiltonians
- Often uses different variables for different parts
- Then:

$$\text{Error} = \epsilon (\Delta t)^{p+1} [H_0, H_{\text{pert}}]$$

Example: Leap-Frog

$$H = \frac{1}{2}p^2 + \Phi(x)$$

Drift Kick

Example: SWIFT/MERCURY

$$H = \frac{1}{2}p^2 + \Phi_{\text{Kepler}}(x) + \Phi_{\text{Other}}(x)$$

Kepler Kick

Example: Symplectic Epicycle Integrator

$$H = \underbrace{\frac{1}{2}p^2 + \Omega(p \times r)e_z + \frac{1}{2}\Omega^2 [r^2 - 3(r \cdot e_x)^2]}_{\text{Epicycle}} + \underbrace{\Phi(r)}_{\text{Kick}}$$

10 Orders of magnitude better!

non-symplectic

symplectic

mixed variable, symplectic

Take home message IV

symplectic integrators
=
awesome

REBOUND

- Multi-purpose N-body code
- Optimized for collisional dynamics
- Code description paper recently accepted by A&A
- Written in C, open source
- Freely available at <http://github.com/hannorein/rebound>

REBOUND modules

Geometry

- Open boundary conditions
- Periodic boundary conditions
- Shearing sheet / Hill's approximation

Integrators

- Leap frog
- Symplectic Epicycle integrator (SEI)
- Wisdom-Holman mapping (WH)

Gravity

- Direct summation, $O(N^2)$
- BH-Tree code, $O(N \log(N))$
- FFT method, $O(N \log(N))$

Collision detection

- Direct nearest neighbor search, $O(N^2)$
- BH-Tree code, $O(N \log(N))$
- Plane sweep algorithm, $O(N)$ or $O(N^2)$

Conclusions

Conclusions

Resonances and multi-planetary systems

Multi-planetary systems provide insight in otherwise unobservable formation phase

GJ876	formed in the presence of a disc and dissipative forces
HD128311	formed in a turbulent disc
HD45364	formed in a massive disc
HD200964	did not form at all

Moonlets in Saturn's rings

Small scale version of the proto-planetary disc

Random walk can be directly observed

Caused by collisions and gravitational wakes

REBOUND

N-body code, optimized for collisional dynamics, uses symplectic integrators

Open source, freely available, very modular and easy to use

<http://github.com/hannorein/rebound>
